# Bug Fixes

Rather than new development, this release targets the resolution of the following defects found in initial UAT implementation:

- **CONSORT-4517:** No Rotavirus Data - Rotavirus rates now calculate correctly and display appropriately.
- **CONSORT-4518:** Patient Count Agreement - We've addressed the data issue that was causing the inconsistency in the number of patients seen in coverage rates compared to the same facility's patient lists. Those odd coverage rate calculations exceeding 100% are gone now too.
- **CONSORT-4519 and CONSORT-4472:** AFIX Export Errors - Awardees reported an issue exporting cohort assessments from their UATs. The issue has been resolved. Users should also not receive the "null" error message when attempting to export.
- **CONSORT-4521:** Custom Sharing - The issue preventing Independent Awardees from sharing custom patient list templates has been resolved. Share and share alike!
- **CONSORT-4520, CONSORT-4522 and CONSORT-4523:** Improvements to the Overview Page - You asked, we answered. We've updated the labels and made sure the data displays in the same order for both graph and table views. The hover-over includes the childhood age range and percentages show up when you print. Plus the data reflects the user's state and includes the correct data, as it should.

## **NOTE: Addition of the CDSi Forecaster Version Display in the UI**

This is not exactly a bug, but we want to point out that we've added the CDSi Forecaster version to the UI. You'll find it in the lower left corner of the screen, along with the SMaRT AFIX and Database release numbers.

# Known Issues

Users should be aware of the following new limitations and/or known issues that may occur:

1. Custom Reports run successfully for all patients when the "All Races (Default)" Filter selected, but no data is returned when other Race filters are selected. The issue does not affect any other custom report filters.
2. Similar to the formatting of dates within CSV files, special characters may appear in in CSV exports as a result of Excel formatting defaults.
3. In Independent Awardee deployments, an update will be made to the password reset system to account for varying password rules across multiple systems. This will be addressed in a forthcoming patch.
4. IWeb Awardees with UATs may experience an issue with report sharing related to the version of the shared org-fac-search micro-service.
5. Patients receiving one dose of Menomune before the age of 16 will be marked as complete by the forecaster. This issue has been discussed with the CDSi committee and will be addressed in a future CDSi forecaster patch.

## **Version 1.17.5.1**

The following known issues were previously declared with previous releases of SMaRT AFIX:

1. Small numbers might automatically be formatted as dates within CSV files due to Excel formatting defaults. This is unlikely to occur in regular use cases.
2. Print functionality may be affected by the user electing to print prematurely. This can be remedied by allowing the display to fully load before requesting the print.
3. SMaRT AFIX may not always display a time-out warning. This issue will be addressed with consistency across the STC Suite of products. In the meanwhile, if this occurs, simply sign out and log back in.
4. Records containing discontinued vaccines may provide atypical results.
